

Frost warning and temperature logging system

iMetos Ice is a remote instrument station for your frost vulnerable area. It reads at 5 minute intervals the temperature from a dry and a wet bulb temperature sensor and sends this information to the Metos client database via the inbuilt cellular phone every hour. All data is retrievable via the internet and on the password protected site you can set alarms for certain temperature levels. Within minutes of the alarm value being reached the telephone numbers that you set will be automatically rung.

The station is powered by rechargeable batteries and a solar panel. Additional dry sensors can be attached to monitor temperature up to 300 metres away.

Mounting pole is not included.

Soil moisture content, soil temperature and rainfall can be added to the system to make this a universal recording station.

All that is required is a GPRS sim card and account.
